

jQuery makes it easy to:

	find	elements in an HTML document
	change	HTML content
	listen	to what a user does and react accordingly
	animate	content on the page
	talk	over the network to fetch new content

Document Object Model

A tree-like structure created by browsers so we can quickly find HTML Elements using JavaScript.

What does that DOM structure look like?

HTML document

```
<!DOCTYPE html>
<html>
<head>
  <title>jQuery Adventures</title>
</head>
<body>
  <h1>Where do you want to go?</h1>
  <p>Plan your next adventure.</p>
</body>
</html>
```

Inside the DOM, HTML elements become "nodes" which have relationships with one another.

The DOM

node types: **element** text

```
jQuery(document).ready(function(){
  $("h1").text("Where to?");
});
```

1 download jQuery

2 load it in your HTML document

```
<script src="jquery.min.js"></script>
```

3 start using it

```
<script src="application.js"></script>
```

CSS		jQuery
<code>p { ... }</code>		<code>\$("#p");</code>
<code>#container { ... }</code>	↔	<code>\$("#container");</code>
<code>.articles { ... }</code>		<code>\$(".articles");</code>

the space matters

```
$("#destinations li");
```

parent *descendant*

```
$("#destinations > li");
```

immediate children

```
$(".promo, #france");
```

```
$("#destinations li:first");
```

```
$("#destinations li:last");
```

```
$("#destinations li:odd");
```

```
$("#destinations li:even");
```

```
$("#destinations").find("li");
```

selection

traversal

It takes a bit more code, but it's faster.

```
$("li").first();
```

```
$("li").last();
```

```
$("li").first().next();
```

```
$("li").first().next().prev();
```

```
$("li").first().parent();
```

```
$("#destinations").children("li");
```

children(), unlike find(), only selects direct children

```
var price = $('<p>From $399.99</p>');
```

Creates a node but doesn't add it to the DOM

application.js

```
$(document).ready(function() {  
  var price = $('<p>From $399.99</p>');  
});
```

ways to add this price node to the DOM

.append(<element>)

.prepend(<element>)

.after(<element>)

.before(<element>)

application.js

```
$(document).ready(function() {  
  var price = $('<p>From $399.99</p>');  
  $('.vacation').before(price);  
});
```

Puts the price node before .vacation

DOCUMENT

application.js

```
$(document).ready(function() {  
  var price = $('<p>From $399.99</p>');  
  $('.vacation').after(price);  
});
```

Puts the price node after .vacation

DOCUMENT

application.js

```
$(document).ready(function() {  
  var price = $('<p>From $399.99</p>');  
  $('<div class="vacation"></div>').prepend(price);  
});
```

Adds the node to the top of .vacation

DOCUMENT

Prepend and Append

application.js

```
$(document).ready(function() {  
  var price = $('<p>From $399.99</p>');  
  $('<div class="vacation"></div>').append(price);  
});
```

Puts the price node at the bottom of .vacation

DOCUMENT

Removing from the DOM

application.js

```
$(document).ready(function() {  
  var price = $('<p>From $399.99</p>');  
  $('<div class="vacation"></div>').append(price);  
  $('<button>').remove();  
});
```

Removes the <button> from the DOM

DOCUMENT

Appending to the DOM

application.js

```
$(document).ready(function() {  
  var price = $('<p>From $399.99</p>');  
  $('.vacation').append(price);  
  $('button').remove();  
});
```

Appends in the

.appendTo(<element>)

.prependTo(<element>)

.insertAfter(<element>)

.insertBefore(<element>)

```
price.appendTo($('vacation'));
```

DOCUMENT

li class="vacation"

h2

Hawaiian Vac...

button

Get Price

Price node (not in the DOM yet)

p

\$399.99

Passing in a function

```
$(document).ready(<event handler function>;
```

The ready method takes an event handler function as argument

```
function() {  
  // executing the function runs the code  
  // between the braces  
}
```

We create a function with the function keyword

```
$(document).ready(function() {  
  // this function runs when the DOM is ready  
});
```

And we pass this function as an argument to the ready method.

Watching for Click

application.js

```
$(document).ready(function() {  
  // runs when the DOM is ready  
});
```

Target all buttons

Watch for any clicks

```
$('#button').on('click', function() {  
  // runs when any button is clicked  
});
```

Run the code inside of this function

DOCUMENT

```
li class="vacation"  
├── h2  
│   └── Hawaiian Vacation  
└── button  
    └── Get Price
```

jQuery Object Methods

.on(<event>, <event handler>)

Removing from the DOM

application.js

```
$(document).ready(function() {  
  $('#button').on('click', function() {  
    // run this function on click  
  });  
});
```

runs when a button is clicked

runs when the DOM is ready

DOCUMENT

```
li class="vacation"  
├── h2  
│   └── Hawaiian Vacation  
└── button  
    └── Get Price
```

Removing from the DOM

application.js

```
$(document).ready(function() {  
  $('#button').on('click', function() {  
    var price = $('<p>From $399.99</p>');  
    $('.vacation').append(price);  
    $('#button').remove();  
  });  
});
```

DOCUMENT

```
li class="vacation"  
├── h2  
│   └── Hawaiian Vacation  
└── p  
    └── $399.99
```

Working, but with Errors

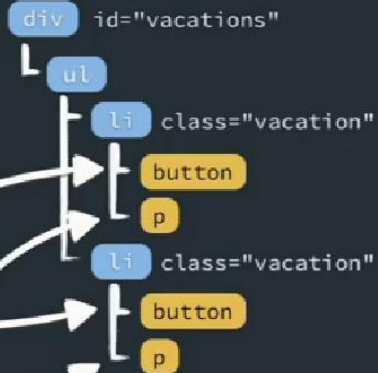

application.js

```
$(document).ready(function() {  
  $('button').on('click', function() {  
    var price = $('<p>From $399.99</p>');  
    $('.vacation').append(price);  
    $('button').remove();  
  });  
});
```

Every button will be removed

The price will be appended to both .vacation elements

DOCUMENT

An Introduction to \$(this)

application.js

```
$(document).ready(function() {  
  $('button').on('click', function() {  
    var price = $('<p>From $399.99</p>');  
    $('.vacation').append(price);  
    $('button').remove();  
  });  
});
```

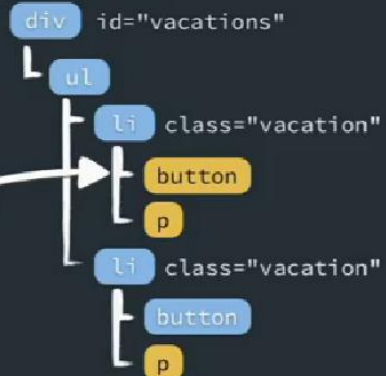

If clicked, the button will be 'this'

```
this.remove();
```

Not a jQuery object, needs to be converted

```
$(this).remove();
```

DOCUMENT

An Introduction to \$(this)

application.js

```
$(document).ready(function() {  
  $('button').on('click', function() {  
    var price = $('<p>From $399.99</p>');  
    $('.vacation').append(price);  
    $(this).remove();  
  });  
});
```

Only removes whichever button was clicked

Traversing from \$(this)

application.js

```
$(document).ready(function() {  
  $('button').on('click', function() {  
    var price = $('<p>From $399.99</p>');  
    $(this).after(price);  
    $(this).remove();  
  });  
});
```

Add the price as a sibling after button

DOCUMENT

Using .closest(<selector>)

application.js

```
$(this).after(price);
```

```
$(this).parent().parent().append(price);
```

```
$(this).parents('.vacation').append(price);
```

```
$(this).closest('.vacation').append(price);
```

DOCUMENT

Our Finished Handler

application.js

```
$(document).ready(function() {
  $('button').on('click', function() {
    var price = $('<p>From $399.99</p>');
    $(this).closest('.vacation').append(price);
    $(this).remove();
  });
});
```

Adds the <p> node at the bottom of .vacation

DOCUMENT

```
<li class="vacation onsale" data-price='399.99'>
  <h3>Hawaiian Vacation</h3>
  <button>Get Price</button>
  <ul class='comments'>
    <li>Amazing deal!</li>
    <li>Want to go!</li>
  </ul>
</li>
```

All data attributes begin with 'data-'

```
$('.vacation').first().data('price');
"399.99"
```

jQuery Object Methods

.data(<name>)

.data(<name>, <value>)

```
$(document).ready(function() {
  $('button').on('click', function() {
    var price = $('<p>From $399.99</p>');
    $(this).closest('.vacation').append(price);
    $(this).remove();
  });
});
```

Reads from the data-price attribute

```
var amount = $(this).closest('.vacation').data('price');
var price = $('<p>From $'+amount+'</p>');
```

Joins two strings to create the price

```
$(document).ready(function() {
  $('button').on('click', function() {
    var amount = $(this).closest('.vacation').data('price');
    var price = $('<p>From $'+amount+'</p>');
    $(this).closest('.vacation').append(price);
    $(this).remove();
  });
});
```

Each vacation can have its own price

```
$(document).ready(function() {
  $('button').on('click', function() {
    var vacation = $(this).closest('.vacation');
    var amount = vacation.data('price');
    var price = $('<p>From $'+amount+'</p>');
    vacation.append(price);
    $(this).remove();
  });
});
```

```
$('.vacation button').on('click', function() {});
```

```
$('.vacation').on('click', 'button', function() {});
```

```
$('.vacation.onsale')
```

```
$('.vacation').filter('.onsale')
```

Class Manipulation

```
.addClass(<class>)
```

```
.removeClass(<class>)
```

```
<li class="confirmation">
  ...
  <button>FLIGHT DETAILS</button>
  <ul class="ticket">...</ul>
</li>
```

Clicking this button...

...will show the ticket

```
.ticket {
  display: none;
}
```

Hide ticket on page load

jQuery Air Atlantic - Vacation Confirmation

Confirmations

Hawaiian Vacation

Paid \$399.99 on January 14, 2013.

FLIGHT DETAILS

Call us at 555-25937 to make a reservation today!

watch for click

find the ticket

show the ticket

```
$('.li').length;
```

→ 3

To query how many nodes are on a page.

```
<li class="confirmation">
  ...
  <button>FLIGHT DETAILS</button>
  <ul class="ticket">...</ul>
</li>
```

`.slideDown()`

`.slideUp()`

`.slideToggle()`

application.js

```
$('.confirmation').on('click', 'button', function() {
  $(this).closest('.confirmation').find('.ticket')
});
```

Searches up through ancestors

Searches down through children

```
$(document).ready(function() {
  alert($('.button').length);
  $('.confirmation').on('click', 'button', function() {
    $(this).closest('.confirmation').find('.ticket').slideDown();
  });
});
```

```
$(document).ready(function() {
  $('.confirmation').on('click', 'button', function() {
    $(this).closest('.confirmation').find('.ticket').slideDown();
  });
  $('.confirmation').on('?', 'h3', function() {
    $(this).closest('.confirmation').find('.ticket').slideDown();
  });
});
```

What event should we watch for?

Mouse Events

click

focusin

mousedown

mousemove

mouseover

mouseenter

dblclick

focusout

mouseup

mouseout

mouseleave

```
function showTicket () {
  $(this).closest('.confirmation').find('.ticket').slideDown();
}
$(document).ready(function() {
  $('.confirmation').on('click', 'button', showTicket);
  $('.confirmation').on('mouseenter', 'h3', showTicket);
});
```

Don't add () at the end - that would execute the function immediately

```
$(document).ready(function() {
  $('.vacation').on('?', '.quantity', function() {
  });
});
```

Which event should we use?

Keyboard Events

keypress

keydown

keyup

Form Events

blur

select

change

focus

submit

<http://api.jquery.com/category/events/keyboard-events/>

<http://api.jquery.com/category/events/form-events/>

application.js

```
$(document).ready(function() {
  $('.vacation').on('keyup', '.quantity', function() {
    // Get the price for this vacation
    // Get the quantity entered
    // Set the total to price * quantity
  });
});
```

```
var price = $(this).closest('.vacation').data('price');
➡ '399.99'
```

Returns price as a string

```
var price = +$(this).closest('.vacation').data('price');
➡ 399.99
```

Use + to convert the string to a number

DOCUMENT

`.val(<new value>)`

`.val()`

```
$(document).ready(function() {  
  $('.vacation').on('keyup', '.quantity', function() {  
    var price = +$(this).closest('.vacation').data('price');  
    var quantity = +$(this).val();  
    $('#total').text(price * quantity);  
  });  
});
```

Whenever the quantity is changed, the total will be updated

```
$(document).ready(function() {  
  $('.vacation').on('click', '.expand', function() {  
    $(this).closest('.vacation')  
      .find('.comments')  
      // Show the comments ul  
  });  
});
```

Query Object Methods

`.fadeIn()`

`.fadeOut()`

`.fadeToggle()`

These are similar to the slide methods

DOCUMENT

```
$(document).ready(function() {
  $('.vacation').on('click', '.expand', function() {
    $(this).closest('.vacation')
      .find('.comments')
      .fadeToggle();
  });
});
```

*fadeIn() .comments on first click,
fadeOut() .comments on next click.*

```
<a href='#' class='expand'>Show Comments</a>
```

*Follows the link!
(goes to the top of the page)*

*The click event will "bubble up"
to each parent node*

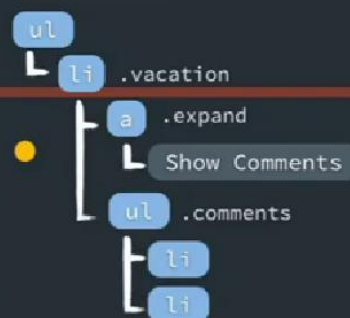

DOCUMENT

application.js

```
$(document).ready(function() {
  $('.vacation').on('click', '.expand',
    function(event) {
      event.stopPropagation();
      $(this).closest('.vacation')
        .find('.comments')
        .fadeToggle();
    });
});
```

DOCUMENT

*The browser will still handle the click event but will prevent it
from "bubbling up" to each parent node.*

application.js

```

$(document).ready(function() {
  $('.vacation').on('click', '.expand',
    function(event) {
      event.preventDefault();
      $(this).closest('.vacation')
        .find('.comments')
        .fadeToggle();
    }
  );
});

```

✓

DOCUMENT

```

ul
├── li .vacation
│   ├── a .expand
│   │   └── Show Comments
│   └── ul .comments
│       ├── li
│       └── li

```

The click event will "bubble up" but the browser won't handle it

.css(<attr>, <value>)

.css(<attr>)

.css(<object>)

```

$(document).ready(function() {
  $('#vacations').on('click', '.vacation', function() {
    $(this).css('background-color', '#252b30');
    $(this).css('border-color', '1px solid #967');
  });
});

```

!

```

$(this).css('background-color', '#252b30')
.css('border-color', '1px solid #967');

```

!

```

$(this).css({ 'background-color': '#252b30',
  'border-color': '1px solid #967' });

```

✓

.show()

.hide()

```
$(this).find('.price').css('display', 'block');
```

```
$(this).find('.price').show();
```

Same as CSS syntax, but easier to read and understand

```
.toggleClass()
```

```
.addClass(<class>)
```

```
.removeClass(<class>)
```

```
.animate(<object>)
```

Takes in a JavaScript object similar to the .css() method

```
$(this).css({'top': '-10px'});
```

The box will jump up 10 p

```
$(this).animate({'top': '-10px'});
```

```
.hasClass(<class>)
```

```

$(document).ready(function() {
    $('#vacations').on('click', '.vacation', function() {
        $(this).toggleClass('highlighted');
        if($(this).hasClass('highlighted')) {
            $(this).animate({'top': '-10px'});
        } else {
            $(this).animate({'top': '0px'});
        }
    });
});

```

Our vacation package will move up and down

```
$(this).animate({'top': '-10px'});
```

```
$(this).animate({'top': '-10px'}, 400);
```

```
$(this).animate({'top': '-10px'}, 'fast');
```

```
$(this).animate({'top': '-10px'}, 200);
```

```
$(this).animate({'top': '-10px'}, 'slow');
```

```
$(this).animate({'top': '-10px'}, 600);
```

We can optionally pass in the speed as a second argument to **animate()**

Effects methods like **animate()**, **slideToggle()** and **fadeToggle()** can also be given a specific speed as a String or in milliseconds

application.js

```
$(document).ready(function() {  
  $('#vacations').on('click', '.vacation', function() {  
    $(this).toggleClass('highlighted');  
  });  
});
```

application.css

```
.vacation {  
  -moz-transition: top 0.2s;  
  -o-transition: top 0.2s;  
  -webkit-transition: top 0.2s;  
  transition: top 0.2s;  
}  
.highlighted {  
  top: -10px;  
}
```

Unlike jQuery, with CSS we have to account for specific browsers
